

Blu-ray Disc World

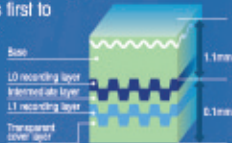

High definition sources, even 50GB, it can record.

Panasonic Blu-ray Disc for Your Valuable Recordings.

The world's first dual-layer, large-capacity, 50-GB disc.

A new layer stack technology allowed us to stack two recording layers, an intermediate layer, and a transparent cover layer into a thickness of only 0.1 mm. A recording film technology with high sensitivity and transmissivity made it possible to achieve the dual-layer structure. And a high-precision forming technology ensured that the intermediate layer has a uniform thickness throughout. These three technologies combine to make Panasonic's Blu-ray Disc the world's first to feature two recording layers and a capacity of 50 GB. It's no surprise that disc is included in the "R&D 100" selection of Research & Development magazine.

The spin-coated cover layer stabilizes recording and playback.

Advanced technology is used to form the cover layer of the Blu-ray Disc, which is the key element for stable data recording. A high-precision spin-coating process produces a cover layer with extremely uniform thickness.
